

Frequently Asked Questions (FAQ)

Ebola Virus Disease (Ebola)

1. What is Ebola?

Ebola is a rare disease that has caused outbreaks (more disease than usual) in West Africa. Right now, there is a large Ebola outbreak in the countries of Guinea and Sierra Leone.

2. How does Ebola spread?

Ebola spreads from person-to-person by direct contact with a patient’s body fluids, like saliva, blood, vomit, urine, feces, and sweat. The virus gets into the body through broken skin or mucous membranes (spongy skin like the kind you find in your nose or mouth). Ebola can also be spread by infected objects, like needles, that have been tainted with body fluids. Ebola can also spread after death, when preparing the patient’s body for burial. **Ebola can’t spread through the air, in food, or water.**

It takes 8–10 days for most people to get symptoms, but it can range from 2–21 days. Patients can spread the virus while they have a fever or other symptoms. People who don’t have symptoms can’t spread Ebola.

3. What are the symptoms of Ebola?

Ebola can cause these signs of disease:

- Headache
- Vomiting
- Fever
- Stomach pain
- Weakness
- Lack of appetite
- Diarrhea
- Abnormal bleeding

4. How is Ebola treated?

There is no specific medicine or vaccine for Ebola. Instead, treatment focuses on keeping the patient alive by giving fluids and managing the serious health problems that can happen.

Key Points:

- The risk of getting sick with Ebola is very low in the U.S. and in Solano County.
- Ebola patients can only spread the disease when they have symptoms.
- A person must have direct contact with a patient’s body fluids to be infected.
- The Public Health Division is taking safety measures to prevent its spread in Solano County, if a case were to come here.

5. What can you do to prevent Ebola?

There is very low to no risk of the spread of Ebola to the public. The key is to avoid contact with anyone who is sick with Ebola. The Centers for Disease Control and Prevention (CDC) asks that the public avoid unnecessary travel to countries in West Africa that are currently affected by Ebola, since travelers may not have access to the health care they need if they get sick.

If you recently visited one of these countries, contact Solano Public Health at 707-784-8001. Even if you did not have contact with someone who had Ebola, take your temperature two times each day for 21 days after leaving the affected country. If you get a fever or other symptoms within the 21 days, call your doctor and mention your recent travel.

6. What is the Division of Public Health doing to prevent Ebola in Solano County?

Right now there are no cases of Ebola in Solano County. We are taking safety measures to prevent its spread in Solano County and stop the spread if a case were to come here.

We are working with local doctors, hospitals, the CDC, the California Department of Public Health (CDPH), and others to find anyone who could have the disease; and to ensure they use good infection control practices to prevent the possible spread of Ebola if they see a patient who may have the illness.
